

Company Profile

24 hours a day - modular products

reflecevolution was established in 1997 on a 6 acre, greenfield site in Winsford, Cheshire and is part of the Reflec Group.

Since then we have established ourselves as a custom toll processor serving the food, oral hygiene, plastics, rubber and chemical sectors.

Our main activities are changing particle size. Using a range of specialised equipment, including cryogenic, controlled and ambient mills, with general powder processing, compaction and drying facilities available, our customised services compliment size manipulation. This includes blending of materials using a range of different types of equipment and formulations, and classifying of products to produce a range of particle distribution from one grade of material. Our dry compaction service allows us to produce improved bulk density and flow.

We also offer a complete R&D facility for the development of a new generation of materials and existing products coming into the market. Within the Company we offer trial facilities using scaled down equipment. This allows us to carry out laboratory sized trials for product evaluation before going onto the main plant.

At reflecevolution we believe in an honest and open door policy with our business partners. The benefits based on this approach are the gains from our continuous improvement programmes which can be shared by both parties on an ongoing basis. This approach extends to all customers - large or small. If we do not currently offer the service that you require, subject to justification, we will develop equipment to suit your requirements.

reflecevolution has specialist know how at its disposal in the field of size reduction, enlargement and general processing.

Therefore we offer all our customers the total package. This includes design of turnkey plants and consultancy if required.

...powders or granules - that's fine by us and fine for you
