

Sieving

Small - but perfectly formed...

Our wide range of sieving equipment enables Reflecevolution to produce a wide range of powders from one micron upwards. Whether you require a small quantity of high value material processed or thousands of tonnes on a long-term contract, we can deliver to exact specification and to agreed schedules.

Different substances have different properties but our equipment and our skilled operatives can handle a wide range of processes, including gravity sieving, mechanical sieving, vacuum sieving and air classifying.

Years of experience enables us to process sticky or claggy products, those with low melt properties, electrically charged materials or ones with a high moisture content and produce a perfect powder for you.

...powders or granules - that's fine by us and fine for you
